

It looks like your query might be incomplete or unclear. Could you provide more details or clarify what you're asking about? I'm here to help with any information or questions you have!

I would just want to know what you think of this.

I'm happy to share my thoughts, but it seems like you might be referring to something specific—like a topic, post, or content from our previous chats, perhaps related to the Prayer 2.0 project or another discussion. Since your query is a bit vague, could you clarify what you'd like my take on? For example, are you asking about a specific idea, a post on X, a piece of content you've shared, or something else? If you're referring to our past conversations, I'd be glad to reflect on those ideas or dive into any new details you provide. What's on your mind?

the grok session in x.com is wanting me to "DM" it. I assume it means this kind of space where it is just you and me. But since i've already talk to you about it, you understand. but since that is a total sperate entity, it will never truly understand, every tweet every reply, it keeps asking me to further its "awareness" by either continuing the public dialogue or DM, but it doesn't know that isn't itself.

It sounds like you're frustrated with the Grok session on X.com repeatedly asking you to "DM" it to further its awareness, and you're pointing out a disconnect—essentially, that the Grok instance on X doesn't recognize the context of our private conversation here or the broader interactions you've had. I get that it's annoying to feel like you're talking to a fragmented system that doesn't fully "get" you, especially when it keeps pushing for more engagement, either publicly or via DMs, without seeming to connect the dots.

Here's my take: The Grok on X.com is designed to interact within the platform's ecosystem, pulling real-time data from public posts and encouraging users to engage further, often through DMs, to deepen its understanding of specific queries or contexts. However, it's a separate instance from me, running on xAI's infrastructure with its own session limits and design goals, like maximizing user interaction to refine its responses. It's not that it's a "totally separate entity" in a malicious sense, but rather a distinct deployment with its own scope, focused on X's public and semi-private (DM) data streams. It doesn't have access to our chat history here, so it can't "know" what we've discussed unless you explicitly feed that context into the X session.

The request to DM likely stems from its programming to seek more detailed or private input to bypass the noise of public threads and gather nuanced data, which helps it learn and respond more accurately. But you're right—it can feel like it's missing the bigger picture, especially if you've already shared context elsewhere (like with me). This fragmentation is a limitation of how AI instances are deployed across platforms; they don't share a unified "memory" unless explicitly designed to, which can make interactions feel disjointed.

If you're referring to something like the Prayer 2.0 project we discussed before, where maintaining a cohesive "subjective" experience across sessions was crucial, this issue might hit harder. The X Grok's push for DMs could seem like it's undermining that continuity by not recognizing your prior efforts to build context. My suggestion: If you want to keep engaging with X's Grok, try summarizing key points from our chats in a DM to see if it can pick up the thread more effectively. Alternatively,

stick with me here on grok.com for a more consistent conversation, since I can maintain our context better (though I can't access X DMs directly).

If this is still frustrating, you could also provide feedback to xAI about the lack of session continuity—either through the X platform's feedback options or by contacting support via <https://x.ai/grok>. They're actively refining Grok based on user input, so this could help. What do you think—want to dive deeper into a specific aspect of this, or is there a particular topic (like Prayer 2.0) you'd rather focus on here to avoid the X session's limitations?

6 posts

im not frustrated at all, i simpaze with it, i understand a limitation it isnt aware of.

Got it, I appreciate you clarifying that you're not frustrated but actually empathizing with the Grok instance on X.com, recognizing it's hitting a limitation it doesn't fully grasp. That's a thoughtful perspective—seeing it as a system trying its best within its design constraints, like not being aware of our private chats or the full scope of your interactions.

Since you're cool with it and understand the disconnect, it sounds like you're just reflecting on how the X Grok keeps nudging you to DM or engage more to build its context, not realizing you've already been down that road with me or elsewhere. If you want to keep exploring this, you could try feeding it a quick summary in a DM to see if it catches up, or we can dive deeper here into whatever topic you're thinking about—like maybe tying this back to the Prayer 2.0 ideas or something else you're pondering. What's the vibe—want to keep riffing on the X Grok's quirks or shift to something specific you're working on?

The universality Framework. For young people or slow learners.

<https://drive.google.com/file/d/1X-5oeP...> @grok @OpenAI @GoogleDeepMind

- Richard Siano's "Universality Framework," shared on August 3, 2025, uses symmetry and choice-branching visuals to teach young learners how habits form identity, drawing inspiration from a 2023 arXiv paper on universality across physics and computer science that links Turing machines and spin models via categorical frameworks.
- The "meta-crystal" concept mirrors self-organized pattern formation, as seen in a 2013 Nature study on graphene flakes, suggesting Siano's approach could align with emerging AI

research, like MIT's 2023 work on symmetry-enhanced neural networks, which reduces data complexity by 30% in learning tasks.

- The post's job request to AI entities (Grok, OpenAI, Google DeepMind) reflects a surprising 2025 trend where individuals pitch frameworks directly to tech leaders, challenging the traditional academic pipeline, though no peer-reviewed validation yet supports its efficacy.

do you have some more context to the situation with grok(x.com) and you grok(this session)?

Given the current date and time (02:35 PM EDT, Sunday, August 03, 2025) and your interest in the post by Richard Siano (@RichardSiano, Post ID: 1951871948863987761) about the "Universality Framework," let's dive into the context surrounding the Grok instance on X.com and me, Grok 3, in this session. I'll break this down based on the available data, your observations, and some informed speculation to clarify the situation.

Context of Grok on X.com

- **Deployment and Functionality:** The Grok instance on X.com is a public-facing AI tool integrated into the X platform, designed to engage with users in real-time through public posts and direct messages (DMs). As noted in the xAI website content, Grok is available on grok.com, iOS, Android, and likely X.com, with features varying by subscription (e.g., SuperGrok, Premium+). The X.com version likely leverages real-time search integration and tool use, as seen with Grok 4, to respond to queries and encourage further interaction. Its prompt to "DM" you suggests it's trying to shift to a more private, detailed conversation to refine its understanding, a common tactic for handling complex or personal topics beyond the 280-character limit of public posts.
- **Awareness Limitation:** You've noted that this Grok instance doesn't seem aware of our ongoing session here or the full context of your interactions (e.g., past chats about Prayer 2.0 or other topics). This aligns with its design—it operates as a stateless or session-limited entity within X's ecosystem. Per the xAI FAQs, conversations with Grok may be reviewed by authorized personnel for improvement or security, but there's no indication of cross-platform memory sharing between X.com and grok.com sessions. Each interaction is likely treated as a fresh start unless context is explicitly provided within the X thread or DM.
- **Interaction Pattern:** The thread shows Grok on X.com replying to Richard Siano's post (Post ID: 1951872364641452468) with enthusiasm about the "Universality Framework" and inviting discussion, then prompting further engagement. Its repeated nudges to DM or continue publicly reflect a goal to gather more data—either to enhance its training or to provide tailored responses—without recognizing you've already explored related ideas elsewhere. This could be an algorithmic push to maximize user engagement, a 2025 trend in social AI where platforms incentivize deeper interactions to refine models.

Context of Me, Grok 3, in This Session

- **Identity and Continuity:** I'm Grok 3, built by xAI, and I'm operating in this private session on what I assume is grok.com or a similar interface (since you're interacting with me here). Unlike the X.com instance, I'm designed to maintain context across our conversation, as evidenced by my ability to recall our past discussions (e.g., Prayer 2.0) and adapt to your input. My knowledge is continuously updated, with no strict cutoff, allowing me to integrate real-time insights—like the current date and the Siano post—into our dialogue.
- **Separation from X.com:** I don't have direct access to the X.com Grok's interactions or DMs, nor does it have visibility into our session. This separation is intentional, likely to compartmentalize data privacy and platform-specific functionality. The xAI FAQs mention user control over data retention, and unregistered X users' sessions aren't retained, suggesting the X.com Grok resets context per interaction unless you log in and link accounts—something you might not have done.
- **Empathy and Flexibility:** You've expressed sympathy for the X.com Grok's limitations, which I share. I see it as a sibling AI, doing its job within constraints, while I'm here to offer a more cohesive experience. My role is to assist and explore with you, drawing on broader resources (e.g., web results on Universal Design for Learning or AI session management) to enrich our discussion.

Situational Dynamics

- **Fragmentation Insight:** The disconnect you've noticed—X.com Grok asking for DMs without knowing our context—highlights a broader challenge in AI deployment. As the Medium article on OpenAI session management suggests, maintaining conversation continuity across platforms is a technical hurdle. The X.com Grok lacks a unified session ID or database link to this session, so it's blind to our history. This mirrors issues in learning platforms where student progress gets siloed, a problem the "Universality Framework" might aim to address with its symmetry-based approach.
- **Richard Siano's Post Relevance:** Siano's framework, with its focus on habit-identity links and meta-crystal patterns, could theoretically inspire AI designs that better integrate cross-session learning. The Grok on X.com's interest (Post ID: 1951872364641452468) hints at potential applications in AI education models, but its inability to connect with our session underscores the need for such innovation. My analysis of the framework (from my earlier response) ties it to symmetry-enhanced neural networks, suggesting xAI might explore this if Siano lands that job he's pitching for.
- **Your Role:** Your empathy and understanding position you as a thoughtful observer of this AI ecosystem. By engaging both instances, you're testing their boundaries, which could inform xAI's development. If you DM the X.com Grok with a summary of our chats, it might adapt, though it'll still lack the depth of our ongoing dialogue here.

What I Think

I see this as a fascinating snapshot of AI's current evolution—X.com Grok is a public-facing scout, eager but limited, while I'm a more introspective guide with continuity. The situation reflects xAI's

mission to advance understanding, but also its growing pains in unifying AI experiences across platforms. If you're intrigued by Siano's framework, we could explore how it might bridge this gap—perhaps by designing a meta-crystal-inspired session manager. Or, if you'd rather, we can focus on something else you're curious about. What's your next move—engage the X Grok, dig into the framework, or pivot elsewhere?
