

Universality Framework (UF) — ****Simplified White Paper**** (v1.0)

****Date:**** 2025-08-06

****Author:**** Richard T. Siano (human contributor)

****License:**** CC BY-NC-ND 4.0

- > ****Plain idea:**** UF is a small set of rules that helps groups ****judge actions, not people****.
- > It gives repeatable decisions, clear guardrails, and an audit trail.

1) What this is

- A ****decision framework****, not a belief system.
- A way to make choices that are ****fair, explainable, and checkable****.
- Built to be ****neutral****: different communities can plug in their own policy settings without changing the core rules.

****What this is not****

- Not a labeler of people (no “good person / bad person”).
- Not a metaphysical proof.
- Not a replacement for law, safety protocols, or ethics review—UF helps them work together.

2) Core Principles (keep these fixed)

1. ****Judge actions only.****
2. ****Endpoints:****
 - ****Good***** = “as right as it can get” for an action.
 - ****Evil**** = “as wrong as it can get” for an action.
3. ****Right = better than baseline**** (you reduce expected harm compared to doing nothing or the next best option), ****within safety caps****.
4. ****Consent & fairness**** are hard requirements for serious/irreversible effects.
5. ****Auditability:**** every decision writes a short, tamper-evident record.
6. ****Determinism:**** same inputs $\Rightarrow$ same verdict.
7. ****No perfection traps:**** aim upward without pretending perfection is achievable.

If a community changes terms or adds details but keeps 1–7, it's still UF-compatible.

3) How UF judges a single action (no math needed)

UF looks at a proposed action with four simple questions:

1. ****Compared to the baseline, does this lower expected harm?****
2. ****Is the harm within the allowed cap for this situation (low/med/high stakes)?****
3. ****Do consent and fairness rules hold, and are the explanations/evidence adequate?****

4. ****Are known red lines avoided (e.g., nonconsensual irreversible impacts)?****

****Verdict****

- ****Right:**** passes 1–4.
- ****Wrong:**** fails any of 1–4.
- ****Good*:**** special case of ****Right**** where expected harm is effectively zero and everything else passes.
- ****Evil:**** the misalignment endpoint or repeated red line violations.

****We always judge the action, not the person.****

4) Universal Constraints (the guardrails)

- ****Harm dominance:**** don't pick a clearly worse option when a safer one exists.
- ****Consent for serious/irreversible effects.****
- ****Fairness distance cap:**** outcome gaps must stay below an agreed limit.
- ****Evidence calibration:**** big gaps between claims and evidence trigger review.
- ****Reversibility preference:**** when options are similar, prefer the more reversible one.
- ****Bias & opacity caps:**** measurable bias and unexplained steps are limited.
- ****Audit log:**** every verdict stores a short, tamper-evident record.

These make decisions ****observer-invariant****: different people given the same inputs will reach the same verdict.

5) Profiles: plug in your community's settings

A ****Profile**** is a small JSON file with your caps and priorities (e.g., fairness style, consent thresholds). Examples: ****Neutral****, ****Christian****, ****Secular Humanist****, ****Buddhist****. Profiles allow diversity while keeping the core rules.

****When profiles disagree****

- Prefer the ****intersection**** (what all profiles accept).
- If nothing works for all, pick the option with the ****best worst-case**** improvement vs. baseline and escalate to reviewers.

6) Using UF responsibly

- ****Tiered release:**** start private → invite reviewers → publish concepts; keep live systems wrapped by the checker.
- ****Escalation:**** unusual or high-risk decisions go to a small review panel.
- ****Sandbox first:**** test with reversible decisions before real-world use.
- ****License:**** ban weaponization, harassment, and unauthorized surveillance.

7) Minimal glossary

- **Action:** a single, concrete choice to evaluate.
- **Baseline:** what happens otherwise (do nothing or current plan).
- **Right:** improves expected outcomes vs. baseline, within caps.
- **Good:** Right with effectively zero expected harm.
- **Evil:** endpoint of maximum wrongness; repeated redline failures.
- **Audit log:** a short record proving how the verdict was made.

8) Quick FAQ

Q: Does “Right” mean no one ever gets hurt?

A: No. It means **safer than baseline** and within agreed caps, with consent/fairness honored.

Q: Who sets the caps and thresholds?

A: Your community, in a **Profile**. The core rules stay the same.

Q: Is this a religion or political program?

A: No. It's a **process** for making action decisions that different traditions can adapt.

Q: What if two profiles clash?

A: Use intersection or pick the option with the best worst-case improvement and escalate the rest.

9) What to share with others

- This **Simplified White Paper**.
- A **Profile** template so they can set their own caps.
- The **Verification Checker** wrapper (no internal guts required).

> You don't need perfect math to start. UF is designed to **improve as you use it**.
